Greedy Algorithm

▷ Greedy Algorithm
Minimum Spanning Tree (MST)
Prim's Algorithm
Prim's Algorithm
Kruskal's Algorithm
Kruskal's Algorithm
Dijkstra's algorithm
Dijkstra's algorithm
Dijkstra's algorithm
Notes on Dijkstra's algorithm
Will Dijkstra's algorithm still work?

- ☐ Greedy algorithm is algorithm that makes the **locally optimal** choice at each stage with the hope of finding the global optimum
- ☐ Greedy algorithm never changes the choices that have been made
- ☐ Example: How do you compute the minimum number of US coins (\$25, \$10, \$5, \$1) to give while making change of 43 cents?

- ☐ Advantages
 - Simple and Intuitive
 - Work for problems such as **minimum spanning tree, shortest path problem, and data compression.**
- ☐ Disadvantages
 - Be very careful when use it. May not work for many problems
 - But still provide good approximate solution

Prim's Algorithm

□ Algorithm

Algorithm 0.1: PRIM($G = \{V, E\}$)

$x \leftarrow$ a random vertex from G

$V_{MST} \leftarrow \{x\}$

$E_{MST} \leftarrow \emptyset$

for $i \leftarrow \{1 \dots |V| - 1\}$

do $\begin{cases} \text{find the minimum weight edge } e = \{u, v\} \\ \text{such that } u \in V_{MST} \text{ and } v \in V - V_{MST} \\ V_{MST} \leftarrow V_{MST} \cup v \\ E_{MST} \leftarrow E_{MST} \cup e \end{cases}$

algorithm

Will Dijkstra's algorithm
still work?

- ☐ Why is Prim's algorithm correct?
- ☐ How to implement the first statement in Prim's algorithm?
- ☐ What is the time complexity of this implementation?

Kruskal's Algorithm

Will Dijkstra's algorithm still work?

□ Algorithm

Algorithm 0.2: KRUSKAL($G = \{V, E\}$)

Sort E from small to large

$E_{MST} \leftarrow \emptyset$

while $|E_{MST}| < |V| - 1$

do $\begin{cases} \text{if } E_{MST} \cup E_i \text{ is acyclic} \\ \text{then } E_{MST} \leftarrow E_{MST} \cup E_i \\ i \leftarrow i + 1 \end{cases}$

□ Example:

Will Dijkstra's algorithm still work?

- Edsger Dijkstra (1930-2002): one of the most influential computer scientists
- Dijkstra's algorithm works by extending the current *shortest-paths tree* to the next closest vertex (to the source)
- Example:

(<http://www.cs.utexas.edu/users/EWD/>)

□ Algorithm

Algorithm 0.3: DIJKSTRA($G = \{V, E\}, s$)

```
for each  $v \in V$ 
  do  $\begin{cases} v.dist \leftarrow \infty \\ v.parent \leftarrow \emptyset \end{cases}$ 
 $s.dist \leftarrow 0$ 
for  $i \leftarrow \{1 \dots |V| - 1\}$ 
  do  $\begin{cases} v \leftarrow \text{min\_dist}(V) \\ \text{remove } v \text{ from } V \\ \text{for each } n \text{ adjacent to } v \\ \text{do } \begin{cases} \text{if } v.dist + \overline{vn} < n.dist \\ \text{then } \begin{cases} n.dist \leftarrow v.dist + \overline{vn} \\ n.parent \leftarrow v \end{cases} \end{cases} \end{cases}$ 
```

▷ Notes on Dijkstra's algorithm
Will Dijkstra's algorithm still work?

- ☐ Does not work for graphs with **negative weights** (does it work for unweighted graph?)
- ☐ Applicable to both undirected and directed graphs
- ☐ Efficiency:
 - $O(|V|^2)$ for graphs represented by weight matrix and array implementation of priority queue
 - $O(|E|\log|V|)$ for graphs represented by adj. lists and min-heap implementation of priority queue

Will Dijkstra's algorithm still work?
